5.	(B)	Risk-free rate.
	• • •	Explanation
		The CML originates on the vertical axis from the point of the risk-free rate.
		(Study Session 17, Module 50.1, LOS 50.b)
		Related Material
		SchweserNotes - Book 5
6.	(A)	negative.
		Explanation
		A security's expected Jensen's alpha is the difference between an active manager'
		estimate of a security's expected return and the CAPM expected return. A securit
		that is expected to have a negative alpha will plot below the SML (i.e., the securit
		is overvalued and should be sold or sold short).
		(Study Session 17, Module 50.2, LOS 50.i)
		Related Material
		SchweserNotes - Book 5
7.	(B)	Combining the capital market line (CML) (risk-free rate and efficient frontier) with
	(-)	an investor's indifference curve map separates out the decision to invest from the
		decision of what to invest in.
		Explanation
		Combining the CML (risk-free rate and efficient frontier) with an investor
		indifference curve map separates out the decision to invest from what to invest i
		and is called the separation theorem. The investment selection process is thu
		simplified from stock picking to efficient portfolio construction throug
		diversification.
		The other statements are false. As an investor diversifies away the unsystemati
		portion of risk, the correlation between his portfolio return and that of the marke
		approaches positive one. (Remember that the market portfolio has ne
		unsystematic risk). The SML measures systematic risk, or beta risk.

16. (A) half the returns standard deviation of the risky asset.

Explanation

CFA®

A risk free asset has a standard deviation of returns equal to zero and a correlation of returns with any risky asset also equal to zero. As a result, the standard deviation of returns of a portfolio of a risky asset and a risk-free asset is equal to the weight of the risky asset multiplied by its standard deviation of returns. For an equally weighted portfolio, the weight of the risky asset is 0.5 and the portfolio standard deviation is 0.5 x the standard deviation of returns of the risky asset.

(Study Session 17, Module 50.1, LOS 50.a)

25. (A) contain the same mix of risky assets unless only the risk-free asset is held.

Explanation

CFA®

All portfolios on the CML include the same tangency portfolio of risky assets, except the intercept (all invested in risk-free asset). The tangency portfolio contains none of the risk-free asset and "borrowing portfolios" can be constructed with a negative allocation to the risk-free asset. Portfolios on the CML are efficient (well-diversified) and have no unsystematic risk.

For Further Reference:

(Study Session 17, Module 50.1, LOS 50.c) CFA[®] Program Curriculum, Volume 5, page 520 CFA[®] Program Curriculum, Volume 5, page 532 **Related Material** SchweserNotes - Book 5

26. (C) holding more than 100% of the risky asset.

Explanation

Portfolios that lie to the right of the market portfolio on the capital market line are created by borrowing funds to own more than 100% of the market portfolio (M).

The statement, "holding both the risk-free asset and the market portfolio" refers to portfolios that lie to the left of the market portfolio. Portfolios that lie to the left of point M are created by lending funds (or buying the risk free-asset). These investors own less than 100% of both the market portfolio and more than 100% of the risk-free asset. The portfolio at point R_f (intersection of the CML and the y-axis) is created by holding 100% of the risk-free asset. The statement, "fully diversifying" is incorrect because the market portfolio is fully diversified.

	Explanation
	The Capital Market Line is a straight line drawn from the risk-free rate of return

The Capital Market Line is a straight line drawn from the risk-free rate of return (on the Y axis) through the market portfolio. The market portfolio is determined as where that straight line is exactly tangent to the efficient frontier.

(Study Session 17, Module 50.1, LOS 50.b)

Related Material

CFA®

36. (B) portfolio Y only.

Explanation

Portfolio X's required return is $0.05 + 0.9 \times (0.12-0.05) = 11.3\%$. It is expected to return 13%. The portfolio has an expected excess return of 1.7%

Portfolio Y's required return is $0.05 + 1.1 \times (0.12-0.05) = 12.7\%$. It is expected to return 14%. The portfolio has an expected excess return of 1.3%.

Since both portfolios are undervalued, the investor should sell the portfolio that offers less excess return. Sell Portfolio Y because its excess return is less than that of Portfolio X.

(Study Session 17, Module 50.2, LOS 50.h)

Related Material

SchweserNotes - Book 5

37. (C) Yes, because it is undervalued.

Explanation

In the context of the SML, a security is underpriced if the required return is less than the holding period (or expected) return, is overpriced if the required return is greater the holding period (or expected) return, and is correctly priced if the required return equals the holding period (or expected) return.

Here, the holding period (or expected) return is calculated as: (ending price - beginning price + any cash flows/dividends) / beginning price. The required return uses the equation of the SML: risk free rate + Beta x (expected market rate - risk free rate).

ER = (26 - 20) / 20 = 0.30 or 30%, RR = $8 + (16 - 8) \times 1.7 = 21.6\%$. The stock is underpriced therefore purchase.

(Study Session 17, Module 50.2, LOS 50.h)

Related Material

SchweserNotes - Book 5

38. (C) Sell Buy

Explanation

The required return for Mia Shoes is $0.08 + 0.9 \times (0.15-0.08) = 14.3\%$. The forecast return is 2/15 = 13.3%. The stock is overvalued and the investor should sell it. The required return for Video Systems is $0.08 - 0.3 \times (0.15-0.08) = 5.9\%$. The forecast return is 2/18 = 11.1%. The stock is undervalued and the investor should buy it.

Related Material

39. (C) the expected return for Portfolio Z is 14.8%.

Explanation

CFA®

Portfolio Z has a beta of 1.3 and its required return can be calculated as $7.0\% + 1.3 \times (13.0\% - 7.0\%) = 14.8\%$. Because it plots on the SML, its expected (forecast) return and required return are equal.

The SML plots beta (systematic risk) versus expected equilibrium (required) return. The analyst believes that Portfolio Y is overvalued - any portfolio located below the SML has a forecast return less than its required return and is overpriced in the market. Since Portfolio X plots above the SML, it is undervalued and the statement should read, "Portfolio X's required return is less than its forecast return."

(Study Session 17, Module 50.2, LOS 50.h)

Related Material

SchweserNotes - Book 5

40. (B) all investors who take on risk will hold the same risky-asset portfolio.

Explanation

One of the assumptions of the CAPM is that all investors who hold risky assets will hold the same portfolio of risky assets (the market portfolio). Risk aversion means an investor will accept more risk only if compensated with a higher expected return. In capital market theory, all investors exhibit risk aversion, even an investor who is short the risk-free asset. In the CAPM, a stock's risk is measured as its beta, not its standard deviation of returns.

51. (A) is overvalued.

CFA®

Explanation

Since the equation of the SML is the capital asset pricing model, you can determine if a stock is over- or underpriced graphically or mathematically. Your answers will always be the same.

Graphically: If you plot a stock's expected return on the SML and it falls below the line, it indicates that the stock is currently overpriced, causing its expected return to be too low. If the plot is above the line, it indicates that the stock is underpriced. If the plot falls on the SML, it indicates the stock is properly priced.

Mathematically: In the context of the SML, a security is underpriced if the required return is less than the holding period (or expected) return, is overpriced if the required return is greater the holding period (or expected) return, and is correctly priced if the required return equals the holding period (or expected) return.

(Study Session 17, Module 50.2, LOS 50.h)

56. (A)	overvalued by approximately 1.8%. Explanation To determine whether a stock is overvalued or undervalued, we need to compare the expected return (or holding period return) and the required return (from Capital Asset Pricing Model, or CAPM). Step 1: Calculate Expected Return (Holding period return) The formula for the (one-year) holding period return is: HPR = $(D_1 + S_1 - S_0) / S_0$, where D = dividend and S = stock price. Here, HPR = $(1.50 + 39 - 35) / 35 = 15.71\%$ Step 2: Calculate Required Return The formula for the required return is from the CAPM: RR = $R_r + (ER_M - R_l) \times Beta$ Here, we are given the information we need except for Beta. Remember that Beta can be calculated with: Beta _{stock} = $[cov_{s,m}]/ [\alpha^2m]$. Here we are given the numerator and the denominator, so the calculation is: $0.85 / 0.70^2 = 1.73$. RR = $4.50\% + (12.0 - 4.50\%) \times 1.73 = 17.48\%$. Step 3: Determine over/under valuation The required return is greater than the expected return, so the security is overvalued. The amount = $17.48\% - 15.71\% = 1.77\%$. (Study Session 17, Module 50.2, LOS 50.h) Related Material SchweserNotes - Book 5

62. (B) Investors can lend at the risk-free rate, but borrow at a higher rate.

Explanation

CFA®

Capital market theory assumes that investors can borrow or lend at the risk-free rate. The other statements are basic assumptions of capital market theory.

(Study Session 17, Module 50.2, LOS 50.f)

Related Material

SchweserNotes - Book 5

63. (B) purchase CS only.

Explanation

In the context of the SML, a security is underpriced if the required return is less than the holding period (or expected) return, is overpriced if the required return is greater than the holding period (or expected) return, and is correctly priced if the required return equals the holding period (or expected) return.

Here, the holding period (or expected) return is calculated as: (ending price - beginning price + any cash flows / dividends) / beginning price. The required return uses the equation of the SML: risk free rate + Beta x (expected market rate risk free rate)

- risk-free rate)
- For CS Industries: ER = (30 25 + 1) / 25 = 24%,
 RR = 6 + 1.2 x (15 6) = 16.8%.
 Stock is underpriced purchase.
- For MG Consolidated: ER = (55 50 + 1) / 50 = 12%, RR = 6 + 0.80 x (15 - 6) = 13.2%.

Stock is overpriced - do not purchase.

(Study Session 17, Module 50.2, LOS 50.h)

64. (B) -1.0%.

Explanation

 $RR_{Stock} = R_f + (R_{Market} - R_f) x Beta_{Stock}$, where RR = required return,

R = return, and $R_f = risk-free$ rate

A bit of algebraic manipulation results in:

 $R_{Market} = [RR_{stock} - R_{f} + (Beta_{Stock} \times R_{f})] / Beta_{Stock} = [8 - 5 + (-0.5 \times 5)] / -0.5$

= 0.5 / -0.5 = **-1%**

(Study Session 17, Module 50.2, LOS 50.g)

69. (A) are perfectly positively correlated with each other.	69. (A)	are perfectly positively correlated with each other.
Explanation		Explanation
•		The introduction of a risk-free asset changes the Markowitz efficient frontier into straight line. This straight efficient frontier line is called the capital market lin

CFA®

(CML). Since the line is straight, the math implies that the returns on any two portfolios on this line will be perfectly, positively correlated with each other.

Note: When $r_{a,b} = 1$, then the equation for risk changes

to $s_{port} = W_A S_A + W_B S_B$, which is a straight line. The risky assets for each portfolio on the CML are the same, the tangency (or market) portfolio of risky assets. The CML includes lending portfolios with positive allocations to the risk-free asset, the market portfolio with no allocation to the risk-free asset, and borrowing portfolios with negative allocations to the risk-free asset.

(Study Session 17, Module 50.1, LOS 50.b)

Related Material

SchweserNotes - Book 5

70. (B) The independent variable in the SML equation is the standard deviation of the market portfolio.

Explanation

The SML uses either the covariance between assets and the market or beta as the measure of risk. Beta is the covariance of a stock with the market divided by the variance of the market. Securities that plot above the SML are undervalued and securities that plot below the SML are overvalued.

71. (A) overvalued by 1.1%.

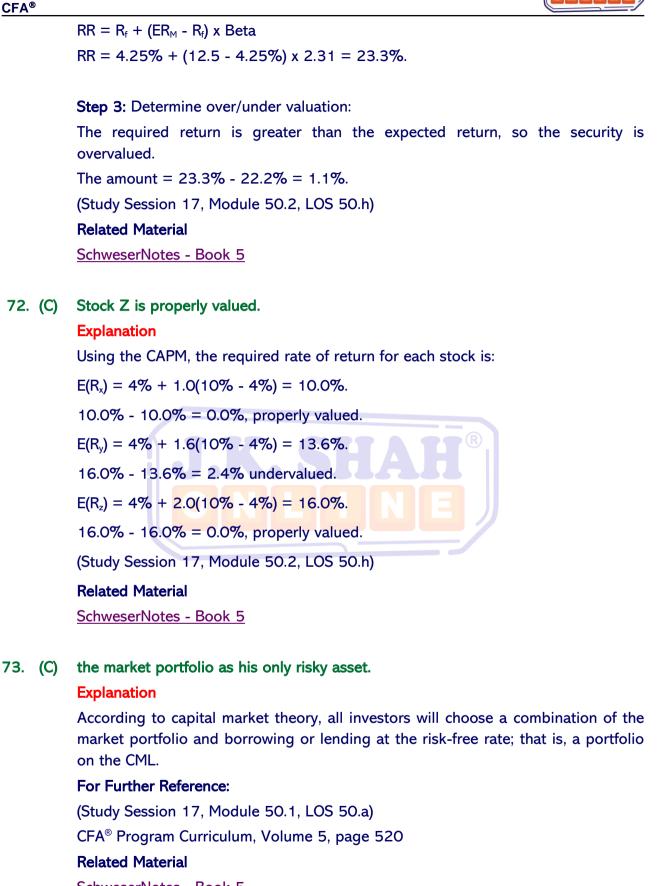

Explanation

To determine whether a stock is overvalued or undervalued, we need to compare the expected return (or holding period return) and the required return (from Capital Asset Pricing Model, or CAPM).

Step 1: Calculate Expected Return (Holding period return): The formula for the (one-year) holding period return is: HPR = $(D_1 + S_1 - S_0) / S_0$, where D = dividend and S = stock price. Here, HPR = (0 + 55 - 45) / 45 = 22.2%

Step 2: Calculate Required Return: The formula for the required return is from the CAPM:

	ONLINE
74. <mark>(</mark> B)	3.
	Explanation
	$24 = 6 + \beta(12 - 6)$
	$18 = 6\beta$
	$\beta = 3$
	(Study Session 17, Module 50.1, LOS 50.e)
	Related Material
	<u>SchweserNotes - Book 5</u>
′5. (C)	
	Explanation
	According to the capital asset pricing model, in equilibrium all securities and portfolios plot on the SML. A security or portfolio is not priced in equilibrium if i plots above the SML (i.e., is undervalued) or below the SML (i.e., is overvalued). (Study Session 17, Module 50.2, LOS 50.f)
	Related Material SchweserNotes - Book 5
	<u>Schwesenholes</u>
'6. (C)	
	Explanation
	In the context of the CML, the measure of risk (x-axis) is total risk, or standard deviation
	Beta (systematic risk) is used to measure risk for the security market line (SML).
	(Study Session 17, Module 50.1, LOS 50.b)
	Related Material
	<u>SchweserNotes - Book 5</u>
77. (B)	nonsystematic risk can be eliminated by diversification.
	Explanation
	In equilibrium, investors should not expect to earn additional return for bearing nonsystematic risk because this risk can be eliminated by diversification. Individual securities have both systematic and nonsystematic risk. Systematic risk is marker risk; nonsystematic risk is specific to individual securities.

79. (B)	M-squared. Explanation M-squared measures the excess return of a leveraged portfolio relative to the market portfolio and produces the same portfolio rankings as Sharpe ratio. (Study Session 17, Module 50.2, LOS 50.i) Related Material SchweserNotes - Book 5
80. (B)	a standardized measure of the total risk of a security. Explanation Beta is a standardized measure of the systematic risk of a security. $\beta = \text{Cov}_{r,mkt} / \sigma^2_{mkt}$ Beta is multiplied by the market risk premium in the CAPM: $E(R_i) = RFR + \beta[E(R_{mkt}) - RFR].$ (Study Session 17, Module 50.1, LOS 50.e) Related Material SchweserNotes - Book 5
81. (C)	Remains the same Decreases Explanation As randomly selected securities are added to a portfolio, the diversifiable (unsystematic) risk decreases, and the expected level of non diversifiable (systematic) risk remains the same. For Further Reference: (Study Session 17, Module 50.1, LOS 50.c) CFA® Program Curriculum, Volume 5, page 532 Related Material SchweserNotes - Book 5
82 (A)	a higher excess return per unit of risk. Explanation The Sharpe ratio is excess return (return - R _f) per unit of risk (defined as the standard deviation of returns). (Study Session 17, Module 50.2, LOS 50.i) Related Material SchweserNotes - Book 5
83. (C)	Treynor measure. Explanation The Treynor measure is excess return relative to beta. The Sharpe ratio measures excess return relative to standard deviation. Jensen's alpha measures a portfolio's excess return relative to return of a portfolio on the SML that has the same beta. 84. (A)	0.61 0.66
	Explanation
	$Beta_i = (s_i/s_M) \times r_{1,M}$
	$BetaPNS = (0.18/0.22) \times 0.75 = 0.6136$
	BetalnCharge = $(0.17/0.22) \times 0.85 = 0.6568$
	Related Material
	<u>SchweserNotes - Book 5</u>
85. (A)	Lambda.
	Explanation
	In the context of the SML, a security is underpriced if its required return is less
	than its estimated holding period return, is overpriced if its required return is
	greater than its estimated holding period return, and is correctly priced if its
	required return is equal to its estimated holding period return.
	Here, estimated holding period return is calculated as: (ending price - beginning
	price + cash flows) / beginning price. The required return based on the CAPM is
	risk free rate + Beta x (expected market rate - risk free rate).
	• For Alpha: ER = (31 - 25 + 2) / 25 = 32%,
	$RR = 4 + 1.6 \times (12 - 4) = 16.8\%$.
	Stock is underpriced.
	• For Omega: $ER = (110 - 105 + 1) / 105 = 5.7\%$,
	$RR = 4 + 1.2 \times (12 - 4) = 13.6\%$
	Stock is overpriced.
	 For Lambda, ER = (10.8 - 10) / 10 = 8%,
	$RR = 4 + 0.5 \times (12 - 4) = 8\%.$
	Stock is correctly priced.
	(Study Session 17, Module 50.2, LOS 50.h)
	Related Material
	<u>SchweserNotes - Book 5</u>
86. (A)	excess return per unit of risk.
	Explanation
	The Sharpe ratio measures excess return per unit of risk. Remember that the
	numerator of the Sharpe ratio is (portfolio return - risk free rate), hence the
	importance of excess return. Note that peakedness of a return distribution is
	measured by kurtosis.

Portfolio Risk and Return Part II

38.	(C)	there are no transactions costs or taxes.
00.	(0)	Explanation
		The CAPM assumes frictionless markets, i.e., no taxes or transactions costs. Among
		the other assumptions of the CAPM are that all investors have the same one-
		period time horizon and that all investments are infinitely divisible.
		(Study Session 17, Module 50.2, LOS 50.f)
		Related Material
		SchweserNotes - Book 5
39.	(B)	are not necessarily well diversified, while portfolios on the CML are well
		diversified.
		Explanation
		Although the risk measure on the capital market line diagram is total risk, all
		portfolios that lie on the CML are well diversified and have only systematic risk.
		This is because portfolios on the CML are all constructed from the risk-free asset and the (well-diversified) market portfolio. Any portfolio, including single
		securities, will plot along the SML in equilibrium. Their unsystematic risk can be
		significant, but it is not measured on the SML diagram because unsystematic risk
		is not related to expected return. Both the CML and the SML reflect relations that
		hold when prices are in equilibrium.
		(Study Session 17, Module 50.2, LOS 50.f)
		Related Material
		SchweserNotes - Book 5
90.	(A)	a straight line.
		Explanation
		The possible portfolios of a risky asset and a risk-free asset have a linear
		relationship between expected return and standard deviation.
		(Study Session 17, Module 50.1, LOS 50.a)
		Related Material
		SchweserNotes - Book 5
91. (((C)	10.2%.
		Explanation
		Use the capital asset pricing model (CAPM) to find the required rate of return. The
		approximate risk-free rate of interest is 5% (2% real risk-free rate + 3% inflation
		premium).
		k = 5% + 1.3(4%) = 10.2%
